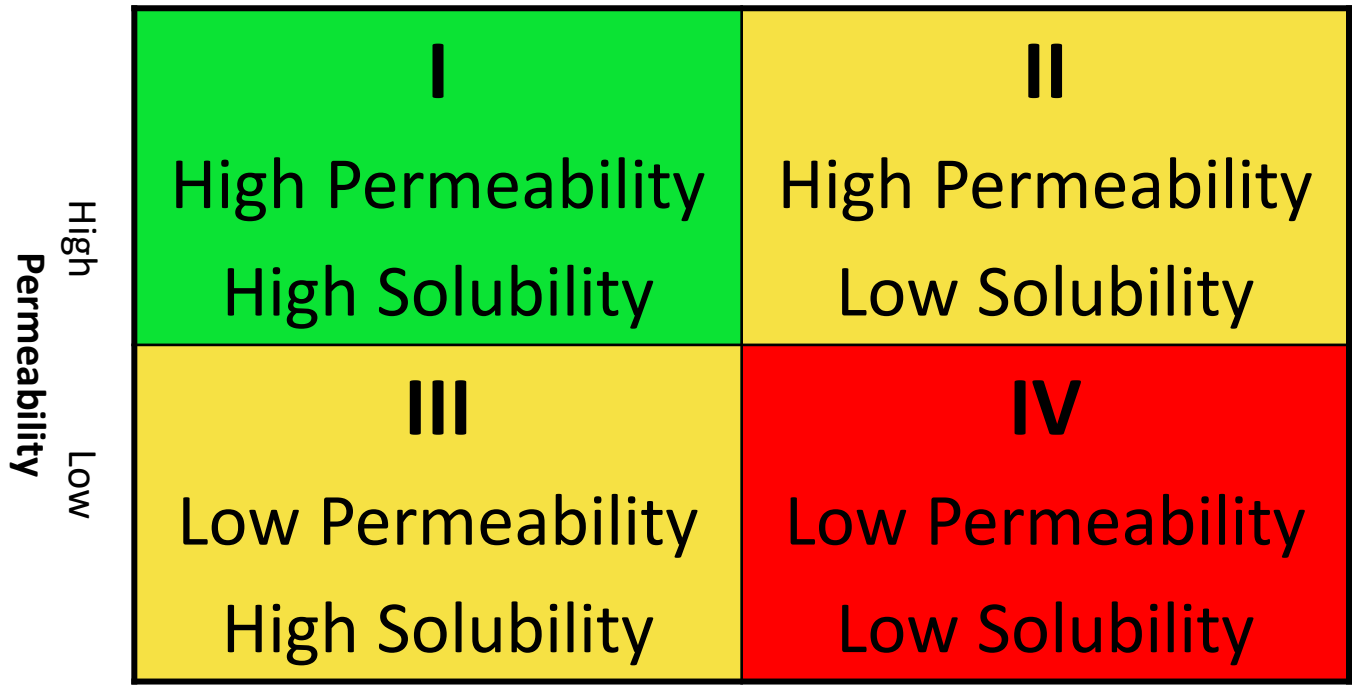
Biopharmaceutics Classification System (BCS)



Development Classification System (DCS) Butler & Dressman (2010) provided an important advance on this as it discriminates particle size and dissolution rate

Amidon GL, Pharm. Res., 12 (3), 1995. - Guidance for industry, Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System. August 2000, CDER/FDA.

JAMES M. BUTLER, and JENNIFER B. DRESSMAN Journal of Pharmaceutical Sciences, Vol. 99, 4940–4954 (2010) The Developability Classification System: Application of Biopharmaceutics Concepts to Formulation Development

MCS: Why have one?

- Borrowing from BCS, use properties of particles to form a new classification to aid drug product manufacturing.

- Defines the "right particles" and "best process".
- Assist in particle engineering to provide targets for API properties.
- Aid development and subsequent transfer to manufacturing.
- Provide a common understanding of risk.
- Fits with QbD principles. Potential of obtaining regulatory relief by demonstrating that the properties of the ingoing API and excipients are within established ranges for the process.

MCS: Initial discussions

APS Joint Focus Group Meeting

BCS to MCS: From the particle to drug product: Predictions from Material Science through to manufacturing

May 13th and 14th 2013, East Midlands Conference Centre, University of Nottingham, UK.

- Mat Sci and PEFDM focus groups

MCS Based on Processing Route

Table II: Properties of an ideal direct-compression material.

Property	Parameter	Target value
Particle size and shape	D 4,3 (mean volume diameter)	>80 μm
	D 10 (10th percentile diameter)	>30 μm
	D 90 (90th percentile diameter)	<1000 μm
	Aspect ratio	<1.5
Blend uniformity	Blend potency	<2% RSD*
Powder flow	Effective angle of internal friction	<41°
Powder density	True	>0.5 g/ml
	Bulk	1.0–2.5 g/ml
Tableting performance	Dwell time sensitivity	Low
	Precompression force	Low
	Compression stress (at ~0.85 solid fraction)	20–125 MPa
Compact mechanical properties	Tensile strength (at ~0.85 solid fraction)	>1.0 MPa
	Brittle fracture index (at ~0.85 solid fraction)	<0.2
	Indentation hardness (at ~0.85 solid fraction)	75–250 MPa

* RSD is relative standard deviation

REVIEW ARTICLE

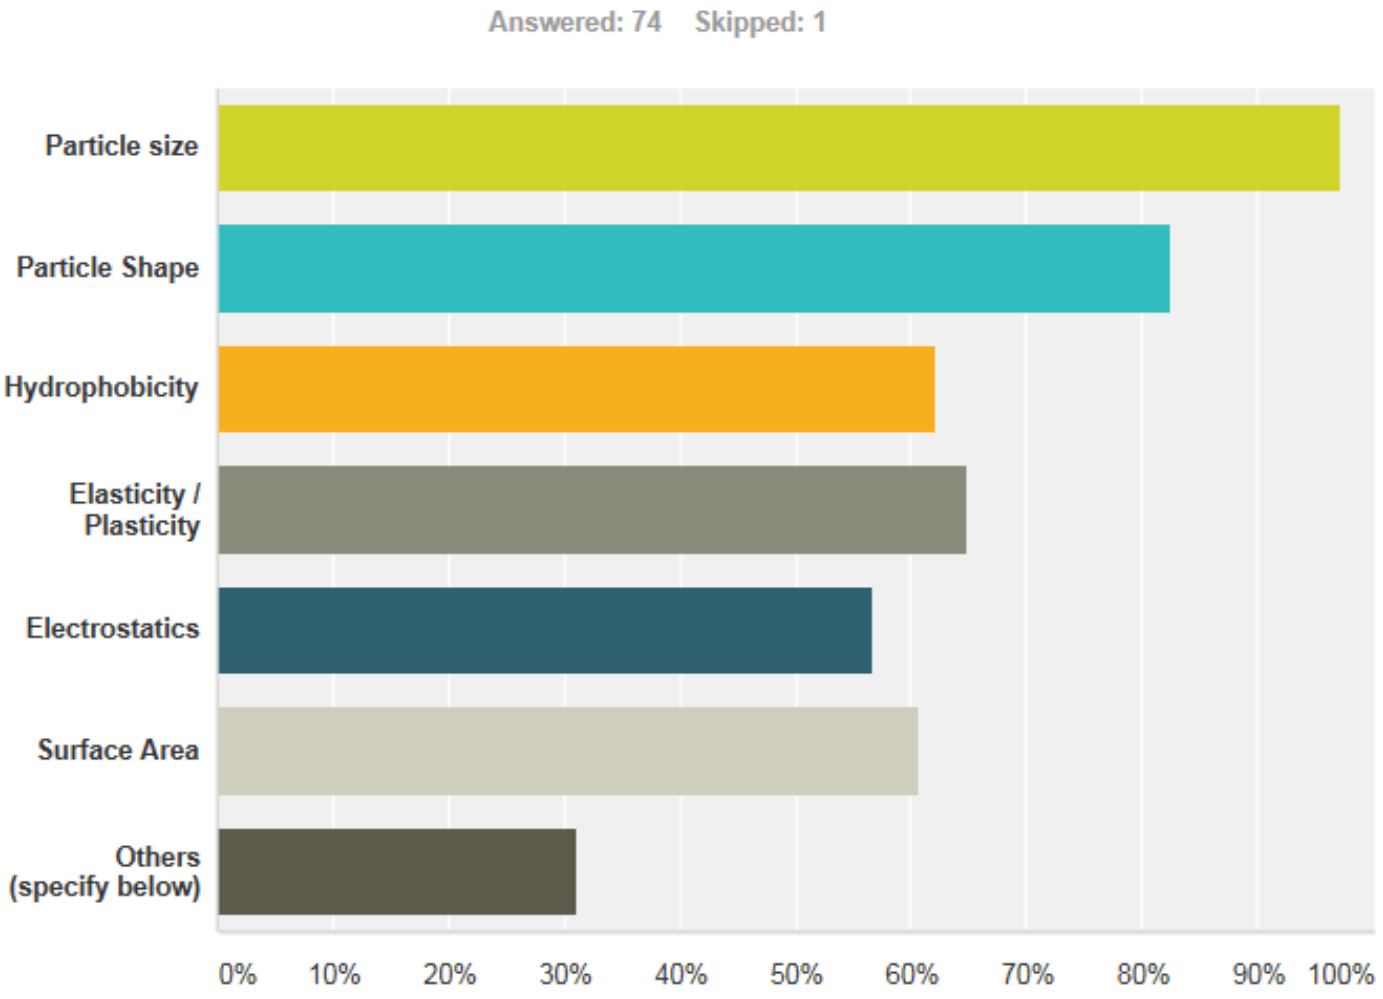
A proposal for a drug product Manufacturing Classification System (MCS) for oral solid dosage forms

Michael Leane[1], Kendal Pitt[2], Gavin Reynolds[3], and The Manufacturing Classification System (MCS) Working Group*

[1]*Bristol-Myers Squibb, Moreton, UK,* [2]*GlaxoSmithKline, Ware, UK, and* [3]*AstraZeneca, Macclesfield, UK*

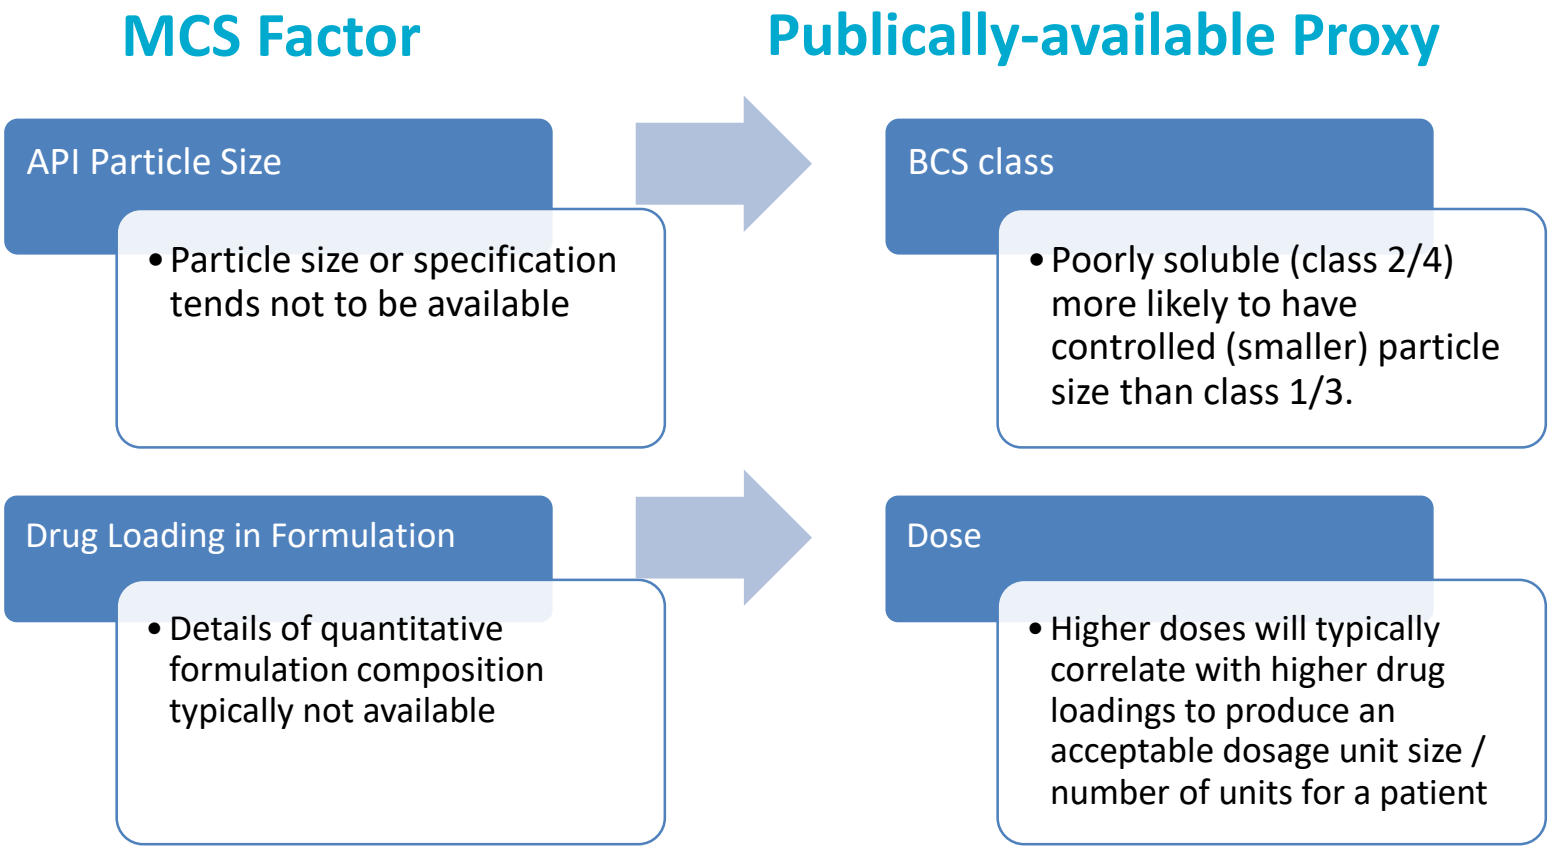
- Industry and academic collaboration
- International contributions
- Feedback questionnaire rolled out

What API properties are important when selecting or modifying materials to enable an efficient and robust pharmaceutical manufacturing process?



Data Mining

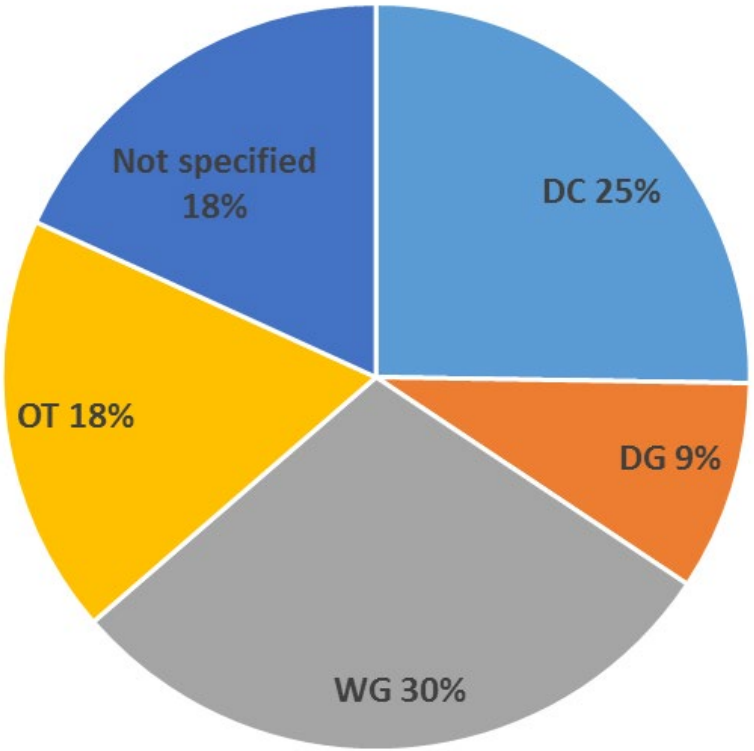
- Data generally proprietary and difficult to access in the public domain

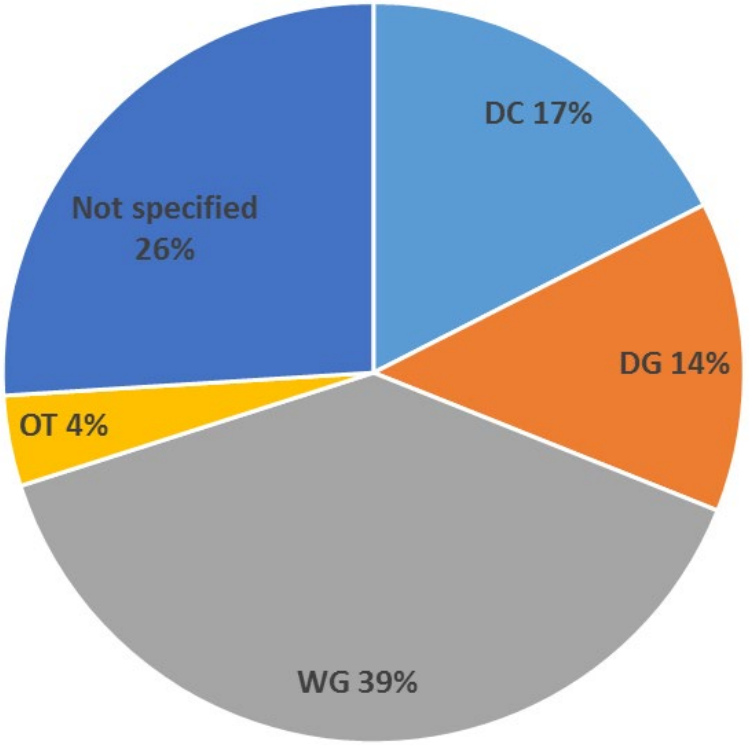


Methodology for Data Mining

- Data collated from EPAR regulatory filings
  - European public assessment reports
  - EMA (European Medicines Agency)
  - Full scientific assessment reports of authorised medicines 1996 – 2017
  - 99 Capsule formulations
  - 354 Tablet formulations
- Data
  - Therapeutic class
  - Commercial name
  - Active pharmaceutical ingredient (API)
  - Range of dose and dosage strengths
  - Dosage form description
  - Manufacturing process description
  - Company responsible for batch release and Marketing Authorisation Holder
  - Date of issue of marketing authorisation valid in European Union

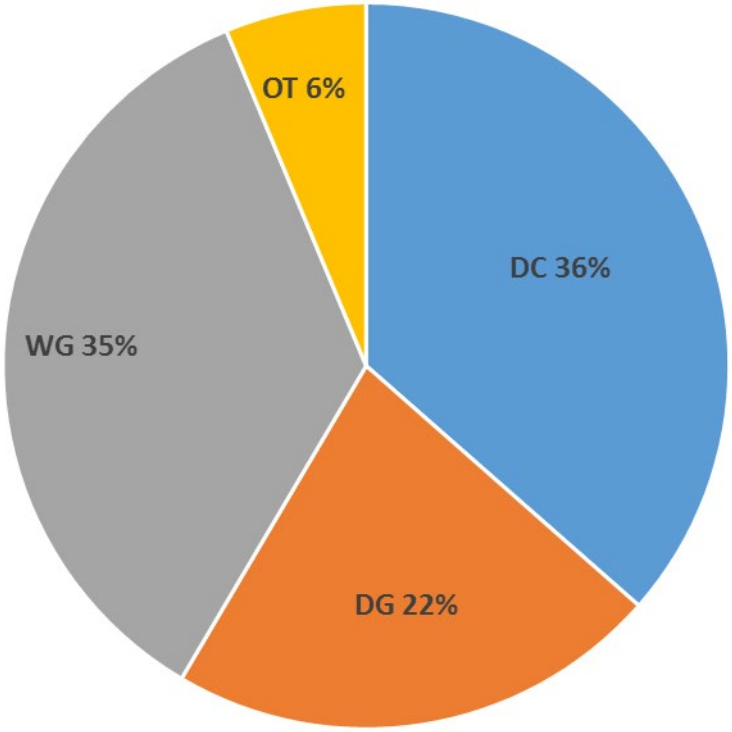
Process Choices for Tablet / Capsule Formulations



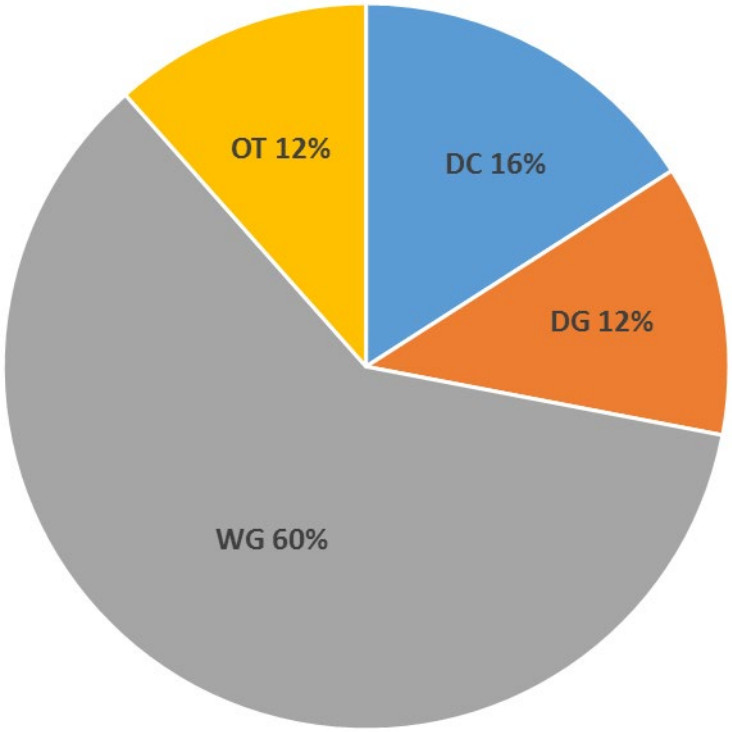


- Capsules (n=99)
  - Roughly equal split between WG and DC
  - Large number of 'OT' formulations
- Tablets (n=354)
  - WG most popular process choice
  - DC only slightly ahead of DG
  - Few 'OT' formulations

Process Choices for Tablet / Capsule Formulations



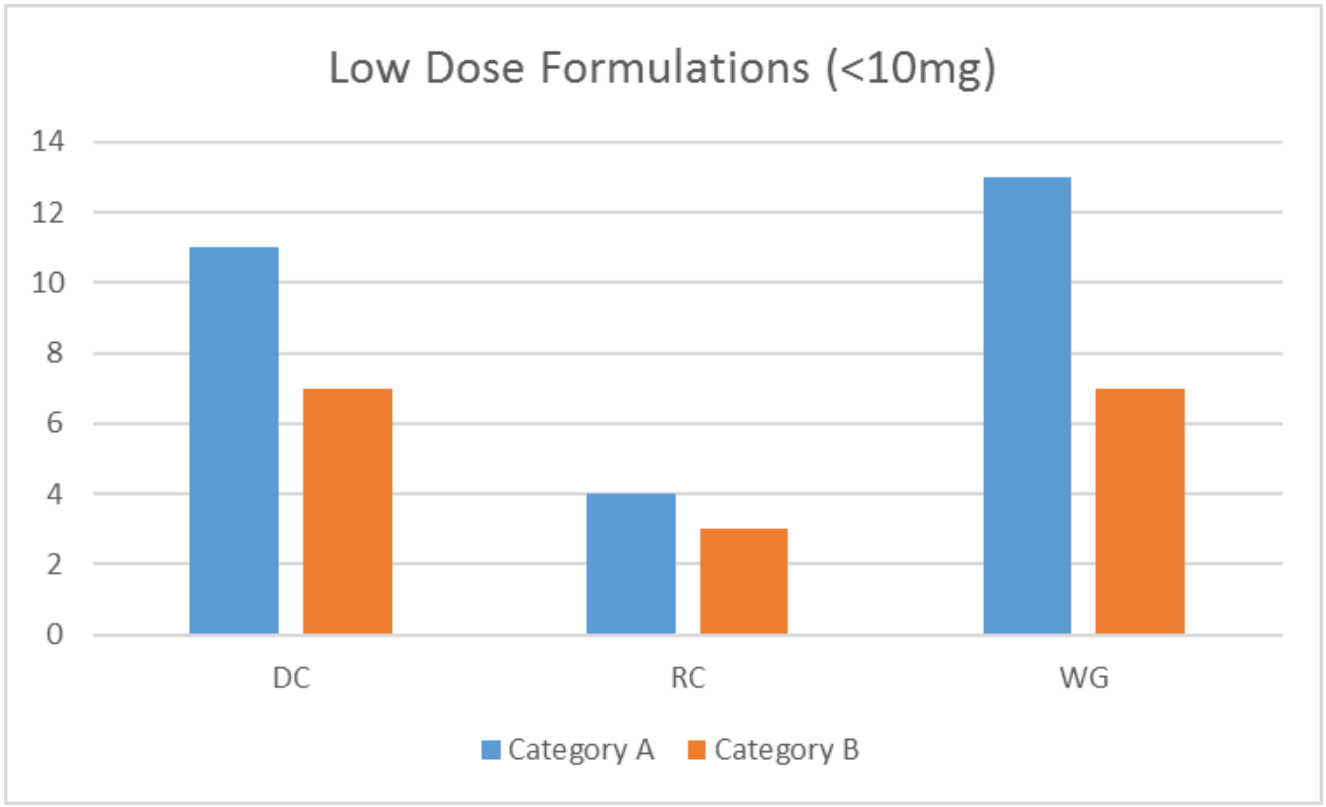
A: Soluble Category A (n=159)



Category B (n=182) **B: Poorly Soluble**

- DC/DE and DG almost 2x as likely for Category A than Category B
- WG and OT almost 2x as likely to be chosen for Category B compounds

Process Choices for Tablet / Capsule Formulations

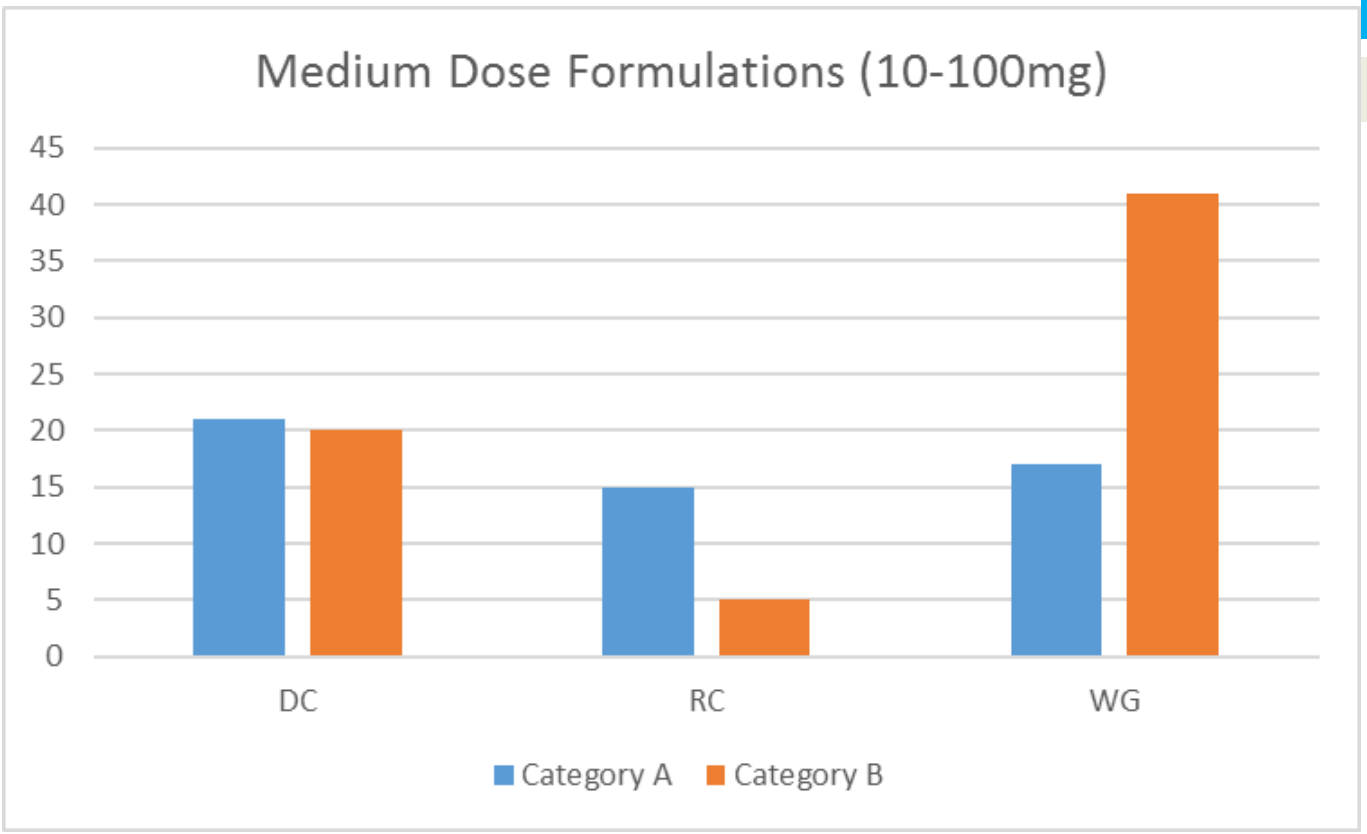


A: Soluble

B: Poorly Soluble

- Higher proportion of DC at lower doses
- RC more likely for Category A
- Category A outnumbers Category B
- WG significant across all doses

Process Choices for Tablet / Capsule Formulations

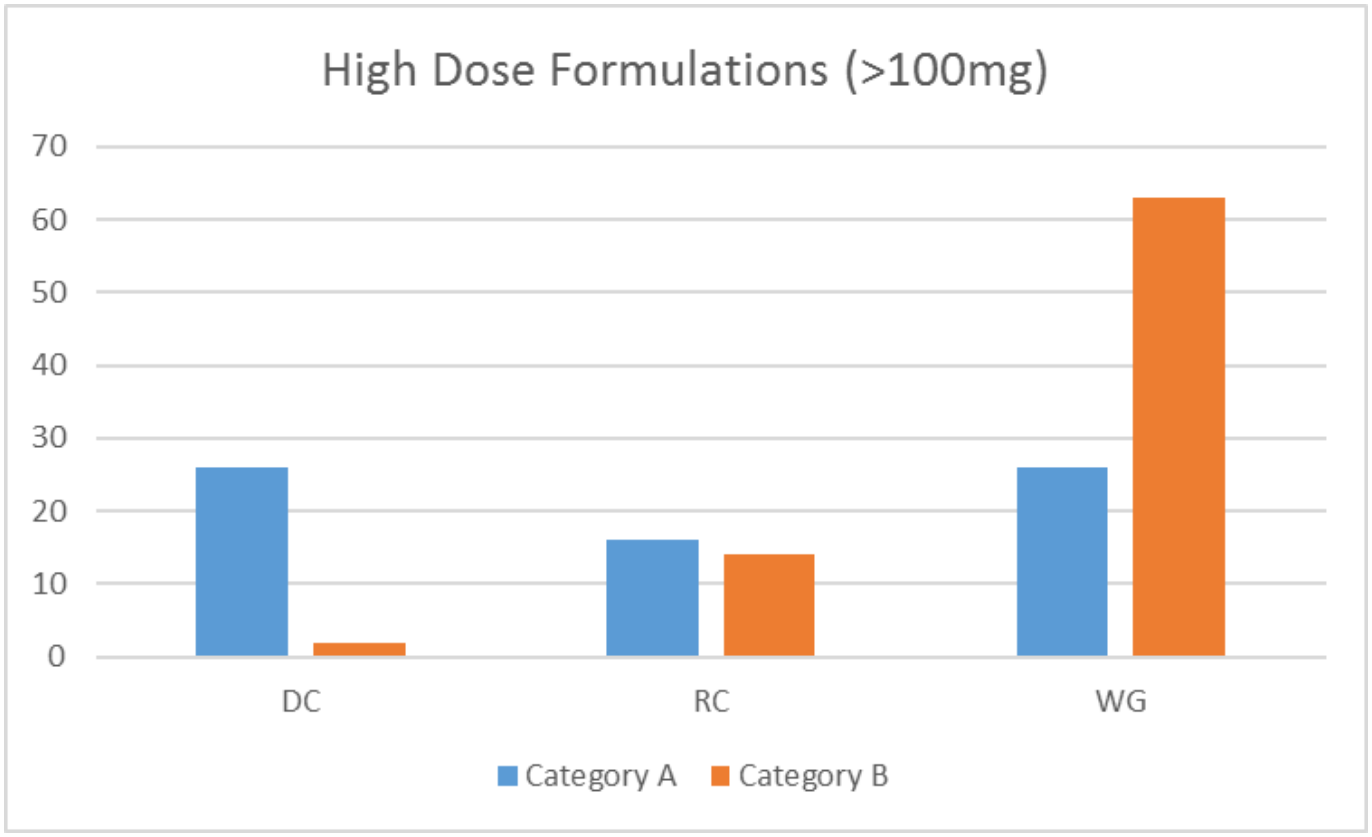


A: Soluble

B: Poorly Soluble

- Higher proportion of DC at lower doses
- RC more likely for Category A
- Category B outnumbers Category A
- WG significant across all doses

Process Choices for Tablet / Capsule Formulations

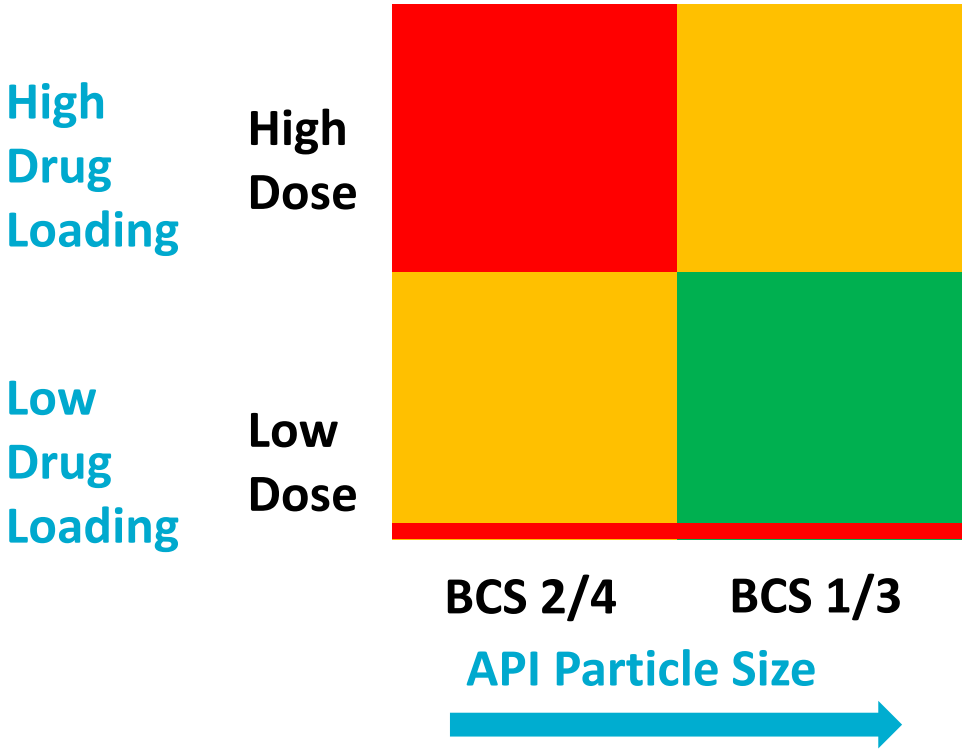


A: Soluble

B: Poorly Soluble

- DC preferred for Category A and WG preferred for Category B
- RC more likely for Category A
- Category B outnumbers Category A
- WG chosen in 80% cases where dose > 100mg & Category B

A ‘High level’ MCS



- Building on the concepts of drug loading and API particle size
- Supported with data analysis of ‘publically-available proxies’
- ‘High level’
  - Clearly exceptions
  - However this may provide a useful first step in assessing potential manufacturing risk
